Package 'geotopbricks'

April 18, 2025

Maintainer Emanuele Cordano <emanuele.cordano@gmail.com>

License GPL (>= 3)

Title An R Plug-in for the Distributed Hydrological Model GEOtop

Type Package

Description It analyzes raster maps and other information as input/output
files from the Hydrological Distributed Model GEOtop. It contains functions
and methods to import maps and other keywords from geotop.inpts file. Some
examples with simulation cases of GEOtop 2.x/3.x are presented in the package.
Any information about the GEOtop Distributed Hydrological Model can be found in the pro-
vided documentation.

Version 1.5.9.1

argsParser   *Parser of an argument string*

Description

This command parses ...DESCRITION TO DO !!!

Usage

```
argsParser(option, args, sep = " ", novalue_response = NULL)
```

Arguments

option	character strings containg options (or flag) whose values
args	String containing all the arguments of an R script
sep	separator character. Default is " ". If it is of length 2, the first is seperator among different options, the second is betwwen option name and its value.
novalue_response	
	value used in case the option is missing. Default is NULL.

Examples

```
args <- "--value  6  --fruit apple"

option <- "--fruit"

value <- argsParser(option=option,args=args)

option2 <- "--jobs"

value2 <- argsParser(option=option2,args=args)
value22 <- argsParser(option=option2,args=args,novalue_response="./")
 args_b <- "value=6 , fruit=apple"
option3 <- "value"
value <- argsParser(option=option3,args=args_b,sep=c(",","="))
```

---

bondone	*Bondone Dataset*

Description

It contains hourly meteorological data observed at MeteoTrentino T0327 station located at Monte Bondone-Viotte (Trentino, Easter Alps, Italy) from August 2004 to December 2012.\

The [zoo](#) object 'meteo' contains:

Iprec Hourly Precipitation Depth expressed in millimeters

AirT Air Temperature expressed in Celsius Degree

RH Relative Humidity in PerCent

WinDir Wind Direction expressed in Degrees North Clockwise

WinSp Wind Direction expressed in meters per second

Swglob Short-Wave Radiation expressed in Watts per square meters

The corresponding time axis vector for each observation can be printed by typing index(meteo).

Usage

```
data(bondone)
```

Format

Data frame , 'zoo' object

Details

This data set stores all meteorological information useful for a GEOtop simulation. The user can easily use the package with his/her own data after replacing the values of such variables.

Source

Original data are provided by Provincia Autonoma di Trento (<https://www.meteotrentino.it/>)).

This dataset is intended for research purposes only, being distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY.

---

brick	*brick*

Description

Added implemetation for 'brick' S4 method

@title brick

Usage

```
## S4 method for signature 'zoo'
brick(
  x,
  layer = 1,
  timerange = NULL,
  time = NULL,
  rows = 1:nrow(x),
  crs = NULL,
  use.read.raster.from.url = TRUE
)

## S4 method for signature 'GeotopRasterBrick'
brick(x)
```

Arguments

x	a 'zoo' object returned by function `pointer.to.maps.xyz.time` or `pointer.to.maps.xy.time` or a `GeotopRasterBrick-class` object
layer	layer at which raster maps are imported. If is NULL, maps ara no-zlayer distributed and zoo must be returend by `pointer.to.maps.xy.time`
timerange	two-elememts vector containing the time range at which geotop maps are imported
time	vector of time instants at which geotop maps are imported
rows	rows of zoo correspondig to the geotop maps that are imported. By default all rows of zoo are considered. It is calculated by `time` or `timerange` if they are not set as NULL.
crs	coordinate system see `RasterBrick-class`
use.read.raster.from.url	
	logical value. Default is TRUE. If TRUE the RasterLayer are read with `read.raster.from.url`, istead of `raster` (otherwise). It is recomended in case the files whose paths are contained in x are remote and are 'http' addresses. In this cases the stand-alone method raster(x) does not always work and use.read.raster.from.url is necessary.

Value

a `RasterBrick-class` containing the geopop maps indicated by x, which is already in a `GeotopRasterBrick-class` object or a 'zoo' object returned by function `pointer.to.maps.xyz.time` or `pointer.to.maps.xy.time`.

See Also

`getvalues.brick.at.depth`,`vertical.aggregate.brick.within.depth`

Examples

```
# TON TOSS
# See the examples in the functions listed in the 'SeeAlso' section
```

---

brick.decimal.formatter

Imports a brick of raster ascii maps into a 'brick' object

Description

Imports a brick of raster ascii maps into a 'brick' object

Usage

```
brick.decimal.formatter(
  file = NULL,
  file_prefix,
  formatter = "%04d",
  file_extension = ".asc",
  nlayers = 10,
  use.read.raster.from.url = FALSE,
  crs = NULL,
  start.from.zero = FALSE
)
```

Arguments

file	fileneme of the 'brick' files containing the decimal formatter. It is NULL by default, otherwise it replaces file_suffix, formatter and file_extension.
file_prefix	character string suffix name of the 'brick' files.
formatter	string value. Default is "%04d" .
file_extension	strinf value. Default is ".asc"
nlayers	number of layers
use.read.raster.from.url	
	logical value. Default is FALSE. (this is recommended in this function). If TRUE the RasterLayer are read with read.raster.from.url, istead of raster (otherwise). It is recomended in case the files whose paths are contained in x are remote and are 'http' addresses. In this cases the stand-alone method raster(x) does not always work and use.read.raster.from.url is necessary.
crs	coordinate system see RasterBrick-class,brick, Default is NULL.
start.from.zero	
	logical value. Default is FALSE. If TRUE the formatter starts from 0000, otherwise it starts from 0001.

Value

the output is returned as a RasterBrick-class object

Examples

```
library(geotopbricks)
library(raster)
file <- system.file("example_files/examples/snowthickness",package="geotopbricks")
file <- paste(file,"SnowThickness0000L%04d.asc",sep="/")
# nlayers=15
nlayers <- 6 ## Only 6 layers are read to minimize the elapsed time of the example!!
b <- brick.decimal.formatter(file=file,nlayers=nlayers)
nlayers(b)
names(b)
```

brickFromOutputSoil3DTensor

brickFromOutputSoil3DTensor

Description

Extracts a brick or a raster layer from a output 3D Tensor or 2D map respectively

Usage

```
brickFromOutputSoil3DTensor(
  x,
  when,
  layers = "SoilLayerThicknesses",
  one.layer = FALSE,
  suffix = "L%04dN%04d.asc",
  time_formatter = "N%04d",
  suffix_one.layer = "N%04d.asc",
  wpath = NULL,
  tz = "A",
  start_date_key = "InitDateDDMMYYYYhhmm",
  end_date_key = "EndDateDDMMYYYYhhmm",
  timestep = "OutputSoilMaps",
  use.read.raster.from.url = FALSE,
  crs = NULL,
  projfile = "geotop.proj",
  start.from.zero = FALSE,
  secondary.suffix = NULL,
  only.map.filename = FALSE,
  add_suffix_dir = NULL,
  ...
)

rasterFromOutput2DMap(x, when, ...)
```

Arguments

x	string. GEOtop keyword reletated to the 3D or 2D variable to be imported in R.
when	[POSIXct-class](#) for date and time on which the variable x is requested.
layers	number of soil layer or geotop keyword for soil layer (e.g. `SoilLayerThicknesses` or `SoilFile`). Default is `SoilLayerThicknesses`.
one.layer	logical value. If TRUE a [RasterLayer-class](#) object is imported, otherwise a [RasterBrick-class](#)object is returened. Default for `brickFromOutputSoil3DTensor` is FALSE

suffix   charachter string containing the decimal formatter used by GEOtop in the output
                            file names. Default is `"L%04dN%04.asc"`. A simple user is recommended not to
                            modify the value of this argument and use the default value.

time_formatter, suffix_one.layer
                            charachter string (`suffix_one.layer` is used for 2Dxy map) containing the dec-
                            imal formatter used by GEOtop in the output file names to indicate time instant.
                            Default is `"N%04.asc"`. A simple user is recommended not to modify the value
                            of this argument and use the default value.

wpath, tz, use.read.raster.from.url
                            see [get.geotop.inpts.keyword.value](#)

start_date_key, end_date_key
                            initial and final detes and times of the GEOtop simulation or alternatively the
                            respective keywords of `*.inpts` file (Default)

timestep   time step expressed in seconds every which the raster file has been created. It
                            can be a string corresponding to the geotop keyword in the inpts file. Default
                            value is `"OutputSoilMaps"`.

crs, start.from.zero
                            see [brick.decimal.formatter](#). If crs is not NULL (Default) , projfile is
                            ignored.

projfile   name of the `*.proj` file containing CRS information. See [get.geotop.inpts.keyword.value](#).
                            Default is `"geotop.proj"`. If is NULL or NA or this file does not exist, it is not
                            searched and read.. In case `use.read.raster.from.url` is TRUE and no NULL
                            or NA values are assinged, the `*.proj` file is searched.

secondary.suffix
                            String secondary suffix which can be added at the end of the Map file name
                            (optional). Default is NULL and no secondary suffix is added.

only.map.filename
                            logical value. If it is TRUE, only map file names are returned and maps are not
                            imported. Default is FALSE.

add_suffix_dir, ...
                            additional arguments for [get.geotop.inpts.keyword.value](#) or [brickFromOutputSoil3DTensor](#)

Details

These functions `brickFromOutputSoil3DTensor` and `rasterFromOutput2DMap` return 3D or 2D
[Raster-class](#) objects respectively. `rasterFromOutput2DMap` is a wrapper function of `brickFromOutputSoil3DTensor`
with the option one.layer==TRUE. The functionswork with the following output keywords:

`"SoilTempTensorFile"`,

`"SoilAveragedTempTensorFile"`,

`"SoilLiqContentTensorFile"`,

`"SoilAveragedLiqContentTensorFile"`,

`"SoilIceContentTensorFile"`,

`"SoilAveragedIceContentTensorFile"`,

`"SoilLiqWaterPressTensorFile"`,

"SoilTotWaterPressTensorFile" for `brickFromOutputSoil3DTensor`;

"FirstSoilLayerTempMapFile",

"FirstSoilLayerAveragedTempMapFile",

"FirstSoilLayerLiqContentMapFile",

"FirstSoilLayerIceContentMapFile",

"LandSurfaceWaterDepthMapFile",

"ChannelSurfaceWaterDepthMapFile",

"NetRadiationMapFile",

"InLongwaveRadiationMapFile",

"NetLongwaveRadiationMapFile",

"NetShortwaveRadiationMapFile",

"InShortwaveRadiationMapFile",

"DirectInShortwaveRadiationMapFile",

"ShadowFractionTimeMapFile",

"SurfaceHeatFluxMapFile",

"SurfaceSensibleHeatFluxMapFile",

"SurfaceLatentHeatFluxMapFile",

"SurfaceTempMapFile",

"PrecipitationMapFile",

"CanopyInterceptedWaterMapFile",

"SnowDepthMapFile",

"GlacierDepthMapFile",

"SnowMeltedMapFile",

"SnowSublMapFile",

"GlacierMeltedMapFile",

"GlacierSublimatedMapFile",

"AirTempMapFile",

"WindSpeedMapFile",

"WindDirMapFile",

"RelHumMapFiladd_suffix_dir=NULLe",

"SWEMapFile",

"GlacierWaterEqMapFile"

"SnowDurationMapFile",

"ThawedSoilDepthMapFile",

"ThawedSoilDepthFromAboveMapFile",

"WaterTableDepthMapFile",

"WaterTableDepthFromAboveMapFile",

"NetPrecipitationMapFile",

"EvapotranspirationFromSoilMapFile" for `rasterFromOutput2DMap`.

plot(m)

## End(Not run)
```

```
create.geotop.inpts.keyword
```
                          Creates an 'geotop.inpts' files the keyword and their
                          values of a date.frame like the one returned by
                          declared.geotop.inpts.keywords

Description

Creates an 'geotop.inpts' files the keyword and their values of a date.frame like the one returned by
declared.geotop.inpts.keywords

Usage

```
create.geotop.inpts.keyword(
  df,
  wpath = NULL,
  comment.lines = "default",
  header = "default",
  like.meteo.keywords = inherits(df, "sf"),
  coords_keywords = c("MeteoStationCoordinateX", "MeteoStationCoordinateY"),
  num_keyword = "NumberOfMeteoStations",
  ...
)
```

Arguments

df	data frame returend by [declared.geotop.inpts.keywords](#)
wpath	complere path to `file` (optional). Default is NULL.
comment.lines	string or vector of strings to add as comments for each keyword. If it is NULL the comment lines are omitted.
header	string or vector of strings to add as a header. If it is NULL the header is omitted.
like.meteo.keywords	
	logical. It is used in case `df` is a `sf` object (geospatial), it often used for meteorological stations
coords_keywords	
	keywords for station coordinates in case `like.meteo.keywords==TRUE`.
num_keyword	keyword for number of stations in case `like.meteo.keywords==TRUE`.
...	further arguments for [writeLines](#)

Details

In case `comment.lines` and `header` are set equal to `"default"`, they are suitably modified within the function code. See the example output.

create.geotop.meteo.files

Creates geotop meteo files from (a list of) 'zoo' objects

Description

Creates geotop meteo files from (a list of) 'zoo' objects

Usage

```
create.geotop.meteo.files(
  x,
  format = "%d/%m/%Y %H:%M",
  file_prefix = "meteo",
  file_extension = ".txt",
  formatter = "%04d",
  na = "-9999",
  col.names = TRUE,
  row.names = FALSE,
  date_field = "Date",
  sep = ",",
  level = NULL,
  quote = FALSE,
  ...
)
```

Arguments

x	'zoo' object or a list of 'zoo' object representing the meteorological station
format	string format representing the date, see [as.POSIXlt](). Default is "%d/%m/%Y %H:%M" (which is the same format used in geotop.inpts keyword InitDateDDMMYYYYhhmm)
file_prefix	string containing file prefix (full path). It correspos to the value of in geotop.inpts keyword MeteoFile)
file_extension	string containing the extensions of final files. Default is c(".txt")
formatter	string value. It is the decimal formatter contained in the file name and used in case the tabular data are referred at several points. Default is "%04d" . See [sprintf]() .

na	NA value indicator. Default is "-9999". See write.table.
col.names	logical parameter. Default is TRUE. See write.table.
row.names	logical parameter. Default is FALSE. See write.table.
date_field	string value. Default is "Date", otherwise defined by the value of HeaderDateDDMMYYYYhhmmMeteo geotop keyword.
sep	string value. Default is ",". See write.table.
level	integer argument. See get.geotop.inpts.keyword.value for major details. Default is NULL and is ignored.
quote	logical parameter. Default is TRUE. See write.table.
...	further arguments for write.table

write.table,get.geotop.inpts.keyword.value

Examples

```
library(geotopbricks)
data(bondone) ## It contains a "meteo" zoo object.

set.seed(12)

file_prefix <- paste(tempdir(),"meteo",sep="/")
level=2
out <- create.geotop.meteo.files(x=meteo,file_prefix=file_prefix,level=level)
## It exports the "meteo" zoo object into a ASCII file for GEOtop
head(readLines(out))
out
```

---

declared.geotop.inpts.keywords

Collects all keywords contained in the 'getop.inpts' configuration files and their values in a data frame object.

Description

Collects all keywords contained in the 'getop.inpts' configuration files and their values in a data frame object.

Usage

```
declared.geotop.inpts.keywords(
  wpath,
  inpts.file = "geotop.inpts",
  comment = "!",
  exceptions = "Date",
  warn = FALSE,
  no.comment = c("!>!", "!>>!"),
  ...
)
```

Arguments

wpath	working directory containing GEOtop files
inpts.file	name of the GEOtop configuration file. Default is `"geotop.inpts"`
comment	comment indicator charcater. Default is `"!"`
exceptions	string vector. If keywords contain an element of this vector, the blank spaces in Value `" "` will not be removed.
warn	logical argument of [readLines](). Default is FALSE.
no.comment	string indicatos read as comment ones by GEOtop but they do not indicate comments by "geotopbricks" package.
...	further arguments of [readLines]()

Value

a data frame with two columns: `Keyword` and `Value`

See Also

geotopbrick   *geotopbrick*

Description

geotopbrick method bla bla bla

Usage

```
geotopbrick(x = NULL, ...)

## Default S3 method:
geotopbrick(x, ...)
```

```
## S3 method for class 'zoo'
geotopbrick(x, layer = NULL, time = NULL, crs = NULL, timerange = NULL, ...)

## S3 method for class 'RasterLayer'
geotopbrick(x, layer = NULL, time = NULL, ascpath = zoo(NULL), ...)

## S3 method for class 'RasterBrick'
geotopbrick(x, layer = NULL, time = NULL, ascpath = zoo(NULL), ...)

## S3 method for class 'GeotopRasterBrick'
geotopbrick(
  x,
  layer = NULL,
  time = NULL,
  crs = NULL,
  timerange = NULL,
  ascpath = NULL,
  ...
)
```

Arguments

x	a 'zoo' object returned by function [pointer.to.maps.xyz.time](#) or [pointer.to.maps.xy.time](#) or a [GeotopRasterBrick-class](#) object
...	further arguments.
layer	layer at which raster maps are imported. If is NULL, maps ara no-zlayer distributed and zoo must be returend by [pointer.to.maps.xy.time](#)
time	vector of time instants at which geotop maps are imported
crs	coordinate system see [RasterBrick-class](#)
timerange	two-elememts vector containing the time range at which geotop maps are imported
ascpath	NULL object or a "zoo" S3 object containing the names of ascii maps provided by GEOtop

Value

a [GeotopRasterBrick-class](#)

GeotopRasterBrick-class

GeotopRasterBrick-class

Description

A GeotopRasterBrick: an object to manage raster maps provied by GEOtop!!

Details

ascpath: A "zoo" S3 object containing the names of ascii maps provided by GEOtop

index: A "POSIXt" S3 object containing time or dates on which raster layers of brick are referred

layer: character. Name of the vertical layer at which raster map are referred

brick: A "RasterBrick-class" S4 object containing the Raster-Layer maps imported from GEOtop output files

#' @note A GeotopRasterBrick object can be created by new("GeotopRasterBrick", ...)

Author(s)

Emanuele Cordano

Examples

```
showClass("GeotopRasterBrick")
```

---

get.geotop.inpts.keyword.value

Importing a GEOtop Keyword and its Value into R

Description

It returns the values of a keyword of "geotop.inpts" file or data frame with the suitable format.

Usage

```
get.geotop.inpts.keyword.value(
  keyword,
  inpts.frame = NULL,
  vector_sep = NULL,
  col_sep = ",",
  numeric = FALSE,
  format = "%d/%m/%Y %H:%M",
  date = FALSE,
  tz = "Etc/GMT-1",
  raster = FALSE,
  file_extension = ".asc",
  add_wpath = FALSE,
  wpath = NULL,
```

```
    use.read.raster.from.url = FALSE,
    data.frame = FALSE,
    formatter = "%04d",
    level = 1,
    date_field = "Date",
    isNA = -9999,
    matlab.syntax = TRUE,
    projfile = "geotop.proj",
    start_date = NULL,
    end_date = NULL,
    ContinuousRecovery = 0,
    ContinuousRecoveryFormatter = "_crec%04d",
    zlayer.formatter = NULL,
    z_unit = c("centimeters", "millimeters"),
    geotop_z_unit = "millimeters",
    add_suffix_dir = NULL,
    MAXNROW = 4,
    header.only = FALSE,
    ...
)
```

Arguments

keyword	keyword name
inpts.frame	data frame returned by [declared.geotop.inpts.keywords](#) or NULL. Default is NULL.
vector_sep	character value for the separator character if Keyword Value must be returned as a vector, otherwise it is NULL. Default is NULL, but if numeric or date are FALSE, vector_sep is set "," by default.
col_sep	character value for the separator character of columuns. It is used if Keyword Value is returned as a data frema or zoo object or list of these objects. Default is NULL, but is set ",".
numeric	logical value. If TRUE the Value has numeric type, otherwise it is a string or string vector. Default is FALSE.
format	string format representing the date, see [as.POSIXlt](#), used if date is TRUE. Default is "%d/%m/%Y %H:%M" (which is the format used in geotop.inpts keyword InitDateDDMMYYYYhhmm)
date	logical value. If TRUE the Value is retured as [POSIXlt](#) date, otherwise it is a string or string vector. Default is FALSE.
tz	format string representing the time zone, see [as.POSIXlt](#), used if date is TRUE. Default is "Etc/GMT-1" (until the previous version it was "A") which meens UTC +1.
raster	logical value. Default is FALSE. If TRUE function returns direclty the raster map as [Raster-class](#) object built with [raster](#) method.
file_extension	Extension to be added to the keyword if keyword is a file name. Default is ".asc"

add_wpath   logical value. Default is FALSE. If TRUE, the wpath string is attached to the keyword string value. It is automatically set TRUE if raster is TRUE.

wpath   working directory containing GEOtop files (included the inpts file). It is mandatory if raster is TRUE. See declared.geotop.inpts.keywords.

use.read.raster.from.url

     logical value. Default is TRUE. If TRUE the RasterLayer are read with read.raster.from.url, istead of raster (otherwise). It is recomended in case the files whose paths are contained in x are remote and are 'http' addresses. In this cases the stand-alone method raster(x) does not always work and use.read.raster.from.url is necessary.

data.frame   logical value. It is an option for tabular data. If TRUE function returns direclty a data frame or a list of data frames as data.frame or zoo objects imported from the keyword-related files using read.table function. In this case the argument wpath (see declared.geotop.inpts.keywords) is mandatory. Default is FALSE.

formatter   string value. It is the decimal formatter contained in the file name and used in case the tabular data are referred at several points. Default is "%04d" . It is used in case data.frame is TRUE.

level   integer values. Numbers incating all the identandification numbers of the files containing the requested data frames. Default is 1, correspondig to the decimal formatter "0001". See examples.

date_field   string value. Default is "Date", otherwise defined by the value of HeaderDateDDMMYYYYhhmmMeteo geotop keyword. It is used only if the argument data.frame is TRUE. If it is NULL or NA the function return a list of generic data.frame object(s), otherwise link{zoo} object(s). See the arguments tz and format for Date formatting.

isNA   numeric value indicating NA in geotop ascii files. Default is -9999.00

matlab.syntax   logical value. Default is FALSE. If TRUE a vector is written in a string according to *.m file syntax. Warning: this synstax is not read by GEOtop.

projfile   fileneme of the GEOtop projection file. Default is geotop.proj.

start_date, end_date

     null objects or dates in POSIXlt format between which the variables are returned. It is enabled in case that date_field is not NULL or NA and data.frame is TRUE. Default is NULL.

ContinuousRecovery

     integer value. Default is 0. It is used for tabular output data and is the number of times GEOtop simulation broke during its running and was re-launched with 'Contiuous Recovery' option.

ContinuousRecoveryFormatter

     character string. Default is '_crec%04d'. It is used only for tabular output data and if ContinuousRecovery is equal or greater than 1.

zlayer.formatter

     decimal formatter. It is used if data.frame==TRUE and the columns refers to different soil depths. Default is NULL.

z_unit   z coordinate measurement unit. GEOtop values expressed in millimeters which are converted to centimeters by default. Default is c("centimeters","millimeters").

	Otherwise can be the ratio between the unit and one meter. It is used if `zlayer.formatter=="z%04d"` or similar.
geotop_z_unit	z coordinate measurement unit used by GEOtop. Default is `millimeters`. It is used if `zlayer.formatter=="z%04d"` or similar.
add_suffix_dir	character string. Add a suffix at the directory reported in the keyword value
MAXNROW	maximum number accepted for `data.frema` output. Default is 4. It is used in case of `data.frame==TRUE`. In case the number of records in the function output is less than `MAXNROW`, function returns neither `data.frame` nor `zoo` objects but only the keyword value.
header.only	logical value. Default is `FALSE`. If it is `TRUE` and `data.frame==TRUE`, only file hedaer with variable names is returned by the function.
...	further arguments of `declared.geotop.inpts.keywords`

Value

the keyword value

Note

If `inpts.frame` is `NULL`, `inpts.frame` will be obtained by calling the function `declared.geotop.inpts.keywords` with `...` arguments.

Examples

```
library(geotopbricks)

#Simulation working path

wpath <-
'https://raw.githubusercontent.com/ecor/geotopbricks_doc/master/simulations/panola13_run2xC_test3'
## URL path (RAW VERSION) of
## https://github.com/ecor/geotopbricks_doc/tree/master/simulations/panola13_run2xC_test3

    }
    })
```

---

get.geotop.points   *Get a* sf *object for Meteorological Stations or Control Points in a GEOtop simulation*

Description

Get a sf object for Meteorological Stations or Control Points in a GEOtop simulation

Usage

```
get.geotop.points(
  prefix = c("MeteoStation", "CoordinatePoint"),
  suffixes = c("Code", "Elevation", "Source"),
 coord_suffixes = list(MeteoStation = c("CoordinateX", "CoordinateY"), CoordinatePoint =
    c("X", "Y")),
  wpath,
  ...,
  vector_sep = ","
)
```

Arguments

`prefix`	keyword prefix
`suffixes`	keyword suffixes
`coord_suffixes`	coordinate keyword suffixes. Default is c("PointX","PointY")
`wpath`	GEOtop simulation path
`vector_sep, ...`	further arguments for `get.geotop.inpts.keyword.value`

Examples

```
###See simulation template: "https://github.com/ecor/geotopbricks_doc/tree/master/template/sumava"
wpath <- "https://raw.githubusercontent.com/ecor/geotopbricks_doc/master/template/sumava/"
## system.file("template/sumava",package="geotopbricks")
out <- get.geotop.points(wpath=wpath)
out <- get.geotop.points(prefix="CoordinatePoint",suffix=c("Code","Source"),wpath=wpath)
out <- get.geotop.points(prefix="MeteoStation",suffix=c("Code","Source"),wpath=wpath)
```

---

get.geotop.recovery.state

This function saves all spatially distrubuted information contained in the recovery folder into a comprehensive list *object.*

Description

This function saves all spatially distrubuted information contained in the recovery folder into a comprehensive `list` object.

Usage

```
get.geotop.recovery.state(
  recFolder,
  xx = "0000",
  formatter = "L%04d",
  extension = ".asc",
  nsoillayers = 10,
  layersFromDir = FALSE,
  ...
)
```

Arguments

`recFolder`	directory when recvery maps are set. In GEOtop it is ...
`xx`	charcter String. Default is `"0000"`
`formatter`	string character for the the decimal formatter to be used. Default is `"L%04d"`.

extension	file estension used for asccii recovery map files. It must contains '.' as the first character. Defaut is ".asc".
nsoillayers	number of soil layers used in the GEOtop simulation.
layersFromDir	logical value. If is TRUE the number of soil/snow (vertical) layers used in the GEOtop simulation is automatically calculated and cannot be assigned through nsoillayers.
...	further arguments

Value

a list object containining all recovery raster maps.

Note

This function has been used with the built 1.225-9 of GEOtop .

---

getProjection	*It reads the CRS metadata utilized in a GEOtop Simulation*

Description

It reads the CRS metadata utilized in a GEOtop Simulation

Usage

```
getProjection(x, cond = TRUE, ...)
```

Arguments

x	name and full path of the file containimg CRS information
cond	logical value. If `FALSE` the function returns NA. Default is `TRUE`.
...	futher arguments

Value

A string corresponding the projection and CRS if the argument cond is `TRUE`.

Examples

```
library(geotopbricks)

wpath <- 'https://raw.githubusercontent.com/ecor/geotopbricks_doc/master/simulations/idroclim_test1'
## URL path  (RAW VERSION) of
## https://github.com/ecor/geotopbricks_doc/tree/master/simulations/idroclim_test1
## Not run:

x <- paste(wpath,"geotop.proj",sep="/")

crs <- getProjection(x)

## End(Not run)
```

---

getvalues.brick.at.depth

Interpolates the values of a 'brick' at a certain depth and returns the map of brick values at the "depth" level

---

Description

Interpolates the values of a 'brick' at a certain depth and returns the map of brick values at the "depth" level

Usage

```
getvalues.brick.at.depth(x, depth, layers, i0 = NULL, verify = FALSE, ...)
```

Arguments

x	a 'RasterBrick' or a three-dimensional array
depth	depth map, generally a 'RasterLayer' object
layers	vector of layer thickness
i0	a 'Raster' containing the number of soil laver just over the bedrock. Default is NULL and is then calculated.

| verify | logical. Default is FALSE. If it is TRUE, it verifies that function is working correctly. |
| ... | further argument |

Value

a list of 'Raster' maps:

i0 a 'Raster' containing the number of soil laver just over the bedrock

val_z0 a 'Raster' containing the values of x at the i0-th layer

val_z1 a 'Raster' containing the values of x at the (i0+1)-th layer

z0 a 'Raster' containing the depth of the center of the i0-th layer

z1 a 'Raster' containing the depth of the center of the (i0+1)-th layer

Note

x and depth or i0 must cover the same spatial region.

See Also

f <- system.file("doc/examples/example.getvalues.brick.at.depth.R",package="geotopbricks")
#  source(f) # Uncomment this line to run the example.
# You can copy the example file using file.copy(from=f,to=....,...) See file.copy documentation
```

KML   *KML*

Description

KML method for a GeotopRasterBrick object

Usage

```
## S4 method for signature 'GeotopRasterBrick'
KML(
  x,
  filename,
  crs = as.character("+proj=longlat +ellps=WGS84 +datum=WGS84 +no_defs"),
  ...
)
```

Arguments

x	the `GeotopRasterBrick` object
filename	mane of the KML file to produce
crs	character string containing the LatLon reference system. Default is "+proj=longlat +ellps=WGS84 +datum=WGS84 +no_defs" (see https://spatialreference.org/ref/epsg/4326/).
...	further argument for S4 method KLM for Raster object.

Note

A coordinate transformation is made with `projectRaster`.

Examples

```
library(geotopbricks)
# The examples is the following R script contained in a 'inst' directory of the package source
f <- system.file("doc/examples/example.KML.GeotopRasterBrick.R",package="geotopbricks")
## Not run:
  source(f) # Uncomment this line to run the example.

## End(Not run)
# You can copy the example file using file.copy(from=f,to=....,...) See file.copy documentation
```

---

max_value   *max_value*

Description

Gets the maximum (scalar) values of a `GeotopRasterBrick` object

Usage

```
max_value(x, na.rm = TRUE, ...)
```

Arguments

x	a `GeotopRasterBrick` object.
na.rm, ...	further arguments for `max`.

Value

the maximum (scalar) values of a `GeotopRasterBrick` object

---

min_value   *min_value*

Description

Gets the minimum (scalar) values of a `GeotopRasterBrick` object

Usage

```
min_value(x, na.rm = TRUE, ...)
```

Arguments

x   a `GeotopRasterBrick` object.

na.rm, ...   further arguments foe `min`.

Value

the minimum (scalar) values of a `GeotopRasterBrick` object

Ops   *Ops*

Description

Ops

Usage

```
## S4 method for signature 'GeotopRasterBrick,GeotopRasterBrick'
Ops(e1, e2)

## S4 method for signature 'GeotopRasterBrick,numeric'
Ops(e1, e2)

## S4 method for signature 'numeric,GeotopRasterBrick'
Ops(e1, e2)
```

Arguments

e1, e2   the `GeotopRasterBrick` or numeric objects

Details

`Ops` method for a `GeotopRasterBrick` object

Note

If e1 or e2 time index is not taken into account.

---

plot	*plot*

Description

plot method for a GeotopRasterBrick object

Usage

```
## S4 method for signature 'GeotopRasterBrick,ANY'
plot(x, y = NULL, ...)
```

Arguments

x	the GeotopRasterBrick object
y	further argument
...	further argument for S4 method plot for Raster object.

```

---

pointer.to.maps.xyz.time

pointer.to.maps.xyz.time

Description

'pointer.to.maps.xyz.time' function (obsolete)

Usage

```
pointer.to.maps.xyz.time(
  wpath,
  map.prefix = "thetaliq",
  suffix = "L%04dN%04d.asc",
  zoo.index = NULL,
  ntime,
  nlayers
)
```

Arguments

wpath	complete working path to *.asc maps are saved
map.prefix	string prefix name map before
suffix	z-time or time suffix plus file extention character string. Default for GEOtop application is `"L%04dN%04d.asc"` for xy+z+time maps or `"N%04d.asc"` for xy+time maps.
zoo.index	time or date index. Default is `NULL` , otherwise function returns a zoo object with `zoo.index` as index.
ntime	number of time instant. If `zoo.index` is not NULL, it is calculated from `zoo.index` length.
nlayers	number of vertical layers.

Value

A data.frame or zoo object containig the paths to maps fpr each time and z layer.

Author(s)

Emanuele Cordano

read.ascii.vectorized.brick

> *Read a text file containing values and matedata of a z-layer brick referred to a time instant (e.g. date). The file is formatted like an ascii format like* 'geotop.inpts' *file.*

Description

Read a text file containing values and matedata of a z-layer brick referred to a time instant (e.g. date). The file is formatted like an ascii format like 'geotop.inpts' file.

Usage

```
read.ascii.vectorized.brick(
  file = NULL,
  comment = "!",
  crs = "",
  NAflag = -9999,
  matlab.syntax = FALSE,
  ...
)
```

Arguments

file	file name to write
comment	character. Comment indicator. Default is "!".
crs	Character or object of class CRS. PROJ4 type description of a Coordinate Reference System (map projection) (optional). See brick or raster.
NAflag	numeric. Dafauli is -9999, see writeRasterxGEOtop.
matlab.syntax	logical value. Default is FALSE. If TRUE the file syntax is like the one of a *.m Matlab script file.
...	further aguments inserted as attribute

Value

the RasterBrick-class object

See Also

write.ascii.vectorized.brick

Examples

```
# see the examples of read.ascii.vectorized.brick
```

`read.raster.from.url`	*It imports a 'RasterLayer' object in Escri-Asci format from a URL 'http(s)://....<FILENAME>.asc*

Description

It imports a 'RasterLayer' object in Escri-Asci format from a URL 'http(s)://....<FILENAME>.asc

Usage

```
read.raster.from.url(x, header_nrow = 6, ...)
```

Arguments

x	the charcater string containing the URL address
header_nrow	Number of header in the ASCII grid format. Deafault is 6. See https://en.wikipedia.org/wiki/Esri_grid
...	additional arguments

Value

a 'RasterLayer' object

Note

This function reads a local or remote text files formatted as https://en.wikipedia.org/wiki/Esri_grid and creates a 'RasterLayer' object.

See Also

[raster](#),[readLines](#)

`read.vectorized.geotop.recovery`	
	Reads a text file like the one generated by [write.vectorized.geotop.recovery](#)

Description

#. containing values and matedata of a z-layer brick referred to a time instant (e.g. date). The file is formatted like an ascii format like `'geotop.inpts'` file.

Usage

```
read.vectorized.geotop.recovery(
  file = file,
  comment = "!",
  matlab.syntax = TRUE,
  xx = "0000",
  formatter = "L%04d",
  extension = ".asc",
  NAflag = -9999,
  crs = "",
  ...
)
```

Arguments

file	file name to write
comment	character. Comment indicator. Default is "!".
matlab.syntax	logical value. Default is TRUE. If TRUE the file syntax is like the one of a *.m Matlab script file.
formatter, extension, xx	
	see `get.geotop.recovery.state`.
NAflag	numeric. Default is -9999, see `writeRasterxGEOtop`.
crs	Character or object of class CRS. PROJ4 type description of a Coordinate Reference System (map projection) (optional). See `brick` or `raster`.
...	further aguments inserted as attribute

Value

a `list` object like `get.geotop.recovery.state`

See Also

`write.vectorized.geotop.recovery`

Examples

```
# see the examples of read.ascii.vectorized.brick
```

---

replace.keyword   *It replaces some keyword values of* geotop.inpts *file with the ones of anoter* *.inpts *value*

Description

It replaces some keyword values of geotop.inpts file with the ones of anoter *.inpts value

Usage

```
replace.keyword(
  x,
  y = "geotop.inpts",
  file.output = NULL,
  write.file.output = TRUE,
  wpath = NULL,
  ...
)
```

Arguments

x	filename of the *.inpts with the "new" keyword value
y	filename of the *.inpts with the "old" keyword value. Default is "geotop.inpts".
file.output	filename where to write the comprehensive new geotop.inpts file. If it is NULL (default), the fileneme is assigned by y.
write.file.output	
	logical value. If it is TRUE, the output of the function is written in he file file.output.
wpath	working path to the GEOtop simulation folder containing the x and y files.
...	further arguments

Details

This function repleces some keword values of y with the ones indicated in y. It is useful to replace the meteo station metedata, for instance, when the meteorological station of a study cases are modified. The function returns the new geotop.inpts file as a vector of character strings. If write.file.output==TRUE, the output is written in an extarnal file, e.g. "geotop.inpts" newly (this option is suggested).

Author(s)

Emanuele Cordano

Examples

```
library(geotopbricks)
wpath <- system.file('template/meteo_ex',package="geotopbricks")
x <- "meteo.inpts"
zl <- replace.keyword(x,wpath=wpath,write.file.output=FALSE)
```

---

set.geotop.recovery.state

This function re-writes the recovery ascii raster maps in a given folder

---

Description

This function re-writes the recovery ascii raster maps in a given folder

Usage

```
set.geotop.recovery.state(rec, newRecFolder, ...)
```

Arguments

rec	a list object returened by get.geotop.recovery.state
newRecFolder	directory where to write all recovery raster asccii maps
...	further arguments

Author(s)

Emanuele Cordano

vertical.aggregate.brick.within.depth

> *Aggregates with a mean or an addition on the vertical profile the values of a 'brick' within a certain depth and returns the vertical aggregated map*

Description

Aggregates with a mean or an addition on the vertical profile the values of a 'brick' within a certain depth and returns the vertical aggregated map

Usage

```
vertical.aggregate.brick.within.depth(
  x,
  depth = NULL,
  layers = NULL,
  i0 = NULL,
  verify = FALSE,
  FUN = identity,
  divide.by.depth = FALSE,
  ...
)
```

Arguments

x	a 'RasterBrick' or a three-dimensional array
depth	depth map, generally a 'RasterLayer' object
layers	vector of layer thickness
i0	a 'Raster' containing the number of soil laver just over the bedrock. Default is NULL and is then calculated.
verify	logical. Default is FALSE. If it is TRUE, it verifies that function is working correctly.
FUN	function used for aggregation. If missing, identity is the default value.
divide.by.depth	
	logical. If TRUE the function returns the 'mean' value, otherwise a a cumulate value. Default is FALSE.
...	further argument for FUN

Value

a list of 'Raster' maps:

i0 a 'Raster' containing the number of soil laver just over the bedrock

z0 a 'Raster' containing the depth of the center of the i0-th layer

result a 'Raster' containing the aggregated map

Note

x and depth or i0 must cover the same spatial region.

Examples

```
library(geotopbricks)
# The examples is the following R script conteined
# in a 'inst' directory of the package source
f <- system.file("doc/examples/example.vertical.aggregate.brick.within.depth.R",
package="geotopbricks")
#  source(f) # Uncomment this line to run the example.
# You can copy the example file using file.copy(from=f,to=....,...) See file.copy documentation
```

---

write.ascii.vectorized.brick

*Writes a z-layer brick referred to a time instant (e.g. date) in an ascii format like '*geotop.inpts*' file.*

Description

Writes a z-layer brick referred to a time instant (e.g. date) in an ascii format like 'geotop.inpts' file.

Usage

```
write.ascii.vectorized.brick(
  b,
  file = NULL,
  header = NULL,
  overwrite = TRUE,
  NAflag = -9999,
  matlab.syntax = FALSE,
  ...
)
```

Arguments

b	a `RasterBrick-class` or `GeotopRasterBrick-class` object
file	file name to write
header	character string vector for header text lines. If missing, a default header is written. #Default is c("! header").
overwrite	logical. Default is TRUE, see `writeRaster`.
NAflag	numeric. Default is -9999, see `writeRasterxGEOtop`.
matlab.syntax	logical value. Default is FALSE. If TRUE the file syntax is like the one of a *.m Matlab script file.
...	further aguments inserted as attribute

Value

the string vector possibly written in `file`.

Note

Add Quote if necessary. This function is NOT maintained and will be DEPRECATED.

Examples

```
## Not Run
## library(geotopbricks)
## library(raster)
## file <- system.file("doc/examples/snowthickness",package="geotopbricks")
## file <- paste(file,"SnowThickness0000L%04d.asc",sep="/")
## b <- brick.decimal.formatter(file=file,nlayers=15)
## nlayers(b)
## names(b)
## file <- "snow.txt"
## btext <- write.ascii.vectorized.brick(b,Date="1/1/2009",file="snow.txt")
## The printed object
## str(btext)
## bb <- read.ascii.vectorized.brick(file = file)
## bf <- abs(as.matrix(bb[[1]]-b[[1]]))<.Machine$double.eps^0.5
```

write.geotop.table | *Writes an R object (*data.frame *or* zoo*) into a CSV file readible by GEOtop.*

Description

Writes an R object (data.frame or zoo) into a CSV file readible by GEOtop.

Usage

```
write.geotop.table(
  x,
  file,
  wpath = NULL,
  tz = "Etc/GMT-1",
  date_field = "Date12.DDMMYYYYhhmm.",
  file_end = "",
  sep = ",",
  format = "%d/%m/%Y %H:%M",
  na = "-9999",
  ...
)
```

Arguments

x	R object (data.frame or zoo) to be exported and written.
file	filename
wpath	working path to the GEOtop simlation. If wpath is not NULL , filename will be put in wpath.
tz	time zone. Default is "Etc/GMT-1". See `get.geotop.inpts.keyword.value` fur further details.
date_field	string used for date-time field. Deafult is "Date12.DDMMYYYYhhmm.". See `get.geotop.inpts.keyword.value` fur further details.
file_end	suffix of the file name (file) (optional). Default is "".
sep	separator character. Default is ",". See `write.table` fur further details.
format	date time format. Default is "%d/%m/%Y %H:%M". See `get.geotop.inpts.keyword.value` fur further details.
na	string for unassigned values. Defaults is "-9999". See `write.table` fur further details.
...	further arguments for `write.table`.

---

write.vectorized.geotop.recovery

> *It writes a* list *object returned by* [get.geotop.recovery.state](#)
> *as a string vector or in a text file, following* *.inpts *or Matlab-like*
> *syntax.*

Description

It writes a list object returened by [get.geotop.recovery.state](#) as a string vector or in a text
file, following *.inpts or Matlab-like syntax.

Usage

```
write.vectorized.geotop.recovery(
  rec,
  file = NULL,
  header = NULL,
  overwrite = TRUE,
  NAflag = -9999,
  matlab.syntax = TRUE,
  ...
)
```

Arguments

rec	a list object returened by [get.geotop.recovery.state](#)
file	ascii text file name whrere to write the string vector
header	character string vector for header text lines. If missing, a default header is written. Default is c("! header") or he one assigned by matlab.syntax.
overwrite	logical. Default is TRUE, see [writeRaster](#).
NAflag	numeric. Default is -9999, see [writeRasterxGEOtop](#).
matlab.syntax	logical value. Default is TRUE. If TRUE the file syntax is like the one of a *.m Matlab script file.
...	further aguments inserted as attribute

Value

a string vector containing the rec variables.

Note

Add Quote if necessary

```

---

write.vectorized.variable.in.string

Writes one or more variables (scalars, vectors or Rasters) in a string each, following `*.inpts` *or Matlab-like syntax.*

Description

Writes one or more variables (scalars, vectors or Rasters) in a string each, following `*.inpts` or Matlab-like syntax.

Usage

```
write.vectorized.variable.in.string(
  l,
  NAflag = -9999,
  matlab.syntax = FALSE,
  ...
)
```

Arguments

`l`	a `list` object contained the variables (scalars, vectors or Rasters) which will be written in a string each.
`NAflag`	numeric. Default is -9999, see [writeRasterxGEOtop](#).
`matlab.syntax`	logical value. Default is `FALSE`. If `TRUE` the file syntax is like the one of a *.m Matlab script file.
`...`	further aguments

Value

the string vector <NAME_VARIABLE>==<VALUES_VARIABLE>.

Note

Add Quote if necessary

See Also

[read.ascii.vectorized.brick](#)

Examples

```
a <- 1:5
l <- list(v=a,a=a)
out <- write.vectorized.variable.in.string(l,matlab.syntax=TRUE)
out
```

---

writeRasterxGEOtop   *This function uses* writeRaster *to create .asc maps which can be read by GEOtop*

Description

This function uses writeRaster to create .asc maps which can be read by GEOtop

Usage

```
writeRasterxGEOtop(
  x,
  filename = NULL,
  overwrite = TRUE,
  NAflag = -9999,
  use.decimal.formatter = FALSE,
  start.from.zero = FALSE,
  keyword,
  wpath,
  suffix.ext = ".asc",
  ...
)
```

Arguments

x	a Raster object, see writeRaster. It can be also a RasterBrick-class object.
filename	see writeRaster. It is a vector of string or one string containing a decimal formatter (see brick.decimal.formatter) in case x is a RasterBrick-class object.
overwrite	logical. Default is TRUE, see writeRaster.
NAflag	numeric. Dafauli is -9999, see writeRaster.
use.decimal.formatter	
	logical value. Default is FALSE. If it is TRUE or x is a RasterBrick-class object with nlayers(x)!=length(filename) , filename is considered as one string containing a decimal formatter (e.g. "%04d", see brick.decimal.formatter). Otherwise, if filename is considered as a vector string.

start.from.zero

        logical value. Default is FALSE. If TRUE the formatter starts from 0000, otherwise
        it starts from 0001.

keyword   geotop keyword to be used to extract the raster file name from geotop.inpts
        file. This is enabled if filename is equal to NULL.

wpath   simulation folder containing geotop.inpts file.

suffix.ext   charachter string to be added to the keyword value,e.g. possible suffix and ex-
        tension of the raster file name. Default is ".asc".

...   further arguments of [get.geotop.inpts.keyword.value](#) or [writeRaster](#)

Note

It makes use of [system](#) functons. It uses *.asc format for raster files. In case the file name
filename is missing and then NULL, it must be imported by the simulation geotop.inpts file.

Examples

```
file <- system.file("ex/elev.tif", package="terra")
elev <- raster(file)

elevfile <- rasterTmpFile()
extension(elevfile) <- ".asc"

writeRasterxGEOtop(x=elev,file=elevfile)
```

---

zoo-class   *A GeotopRasterBrick: an object to manage raster maps provied by*
        GEOtop!!

Description

A GeotopRasterBrick: an object to manage raster maps provied by GEOtop!!

Examples

```
showClass("zoo")
```
